Kanplan

- collaboration workflow –

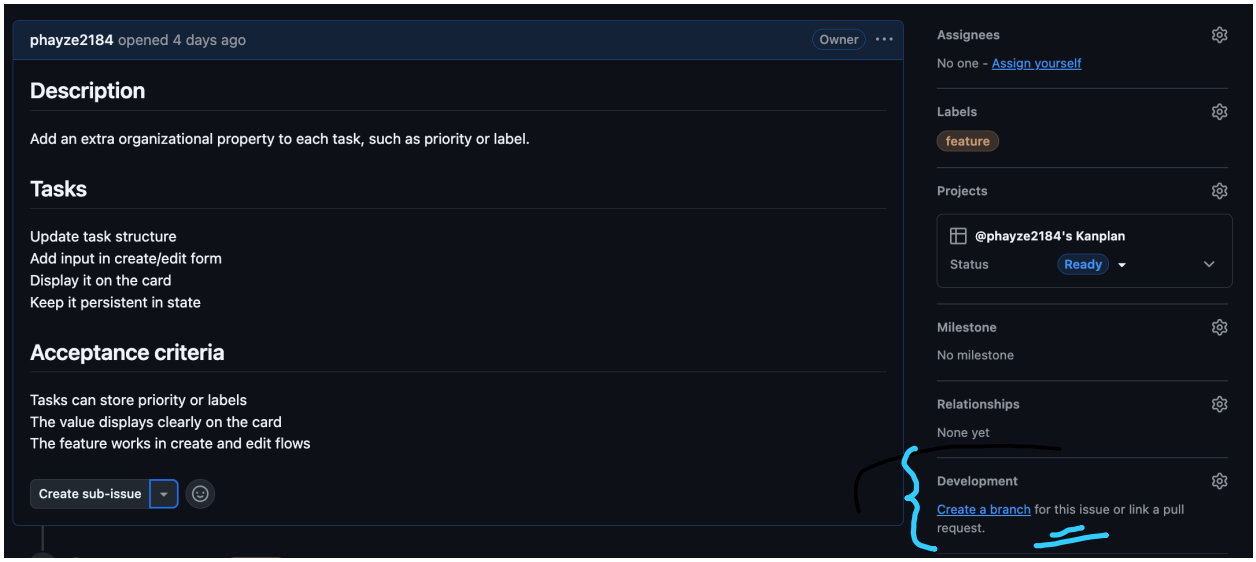
Workflow:

The team member:

- Chooses an issue from the Project board and assigns it to themselves
- (Optional) If the issue is too large, creates smaller sub-issues
- Creates a **new branch from** `main` for that issue
- Works locally and commits changes
- Pushes the branch to GitHub
- Opens a **Pull Request (PR)** linked to the issue
- Requests at least one review

Guidelines:

- Do not push directly to main
- Always create a branch per issue (`feature/...`, `bugfix/...`)
- Keep PRs small and focused (1 issue = 1 PR)
- Write clear commit messages (what + why)
- Test locally before pushing
- Link pull-requests (PRs) to issues
- Link PRs to issues (`Closes #25`)
- Delete branch after merge



Branch naming convention:

Suggested branch types:

- `feature` = new functionality (new functionality visible to the user)
- `bugfix` = fix a bug
- `chore` = tooling, config, dependencies (maintenance, no direct user impact)
- `docs` = documentation
- `refactor` = code cleanup without feature change

Recommended convention:

- `feature/ft-01-data-structure`
- `feature/ft-02-render-board`
- `bugfix/fix-task-delete`
- `chore/add-eslint`
- `docs/update-readme`

Pattern:

`type/issue-short-description`

Keep names:

- lowercase
- hyphen-separated
- short but descriptive
- linked to issue number when possible

Example with issue number:

`feature/25-status-change-between-columns //` The issue number can be found att he end of the name of each issue

Issue template:

1. Description
2. Tasks
3. Acceptance criteria
4. (optional) Notes

Pull request template:

- What changed
- Why this change was made (optional)
- How to test (optional)
- Related issue
